

## **Summary of the Proposed Idaho Workers Compensation Rate Filing Effective January 1, 2026**

The National Council on Compensation Insurance (NCCI)<sup>1</sup> is pleased to provide this summary of the accompanying proposed workers compensation insurance rate filing that was filed under separate cover on September 26, 2025, with the Idaho Department of Insurance for its review and approval.

The filing proposes a -2.5% decrease to the current rates for the voluntary market and a decrease to the surcharge, from 50% to 45%, in the assigned risk market, effective January 1, 2026.

### **Idaho Overview**

The proposed filing is based on premium and loss experience as of year-end 2024 from Policy Years 2021, 2022, and 2023 which shows continued improvement in the voluntary market relative to the data underling the filing effective January 1, 2025. NCCI has observed a long-term trend of improving loss experience in Idaho, driven in part by a reduction in claim frequency.

Based on a review of the long-term relationship between experience in the assigned risk market and statewide markets, a decrease to the assigned risk market surcharge is supported. Thus, this filing proposes a change in the assigned risk market surcharge from 50% to 45%.

### **Multistate Overview**

The Calendar Year 2024 combined ratio for workers compensation was under 100% (the break-even point) at 86%, a measure of underwriting profitability for the overall system. The net written premium in the voluntary market decreased slightly, and the residual market premium in states serviced by NCCI remained approximately the same as last year.

The number of claims occurring, as measured by frequency, and the cost of claims, as measured by severity, continue to be key metrics for the health of the workers compensation system. The frequency of workers compensation lost-time claims continues its long-term decline across all NCCI states. In fact, claim frequency declined at a faster pace in 2024 than the long-term average rate of decline, an indication of safer workplaces and fewer injured workers.

Claim severity increased for both the medical and wage replacement components in 2024. Medical cost increases were driven in part by some inflationary pressures. However, the primary driver of the increase in medical costs was the increased utilization of medical services by injured workers. Physician services account for more than 40% of all workers compensation medical services, although the cost of these services only increased by 1.5% over the past three years. The increase in indemnity benefits is primarily driven by an increase in wages.

### **Decimal Extension of Loss Costs, Rates, and Expected Loss Rates**

---

<sup>1</sup> NCCI is a licensed rating organization authorized to make recommended rate filings on behalf of workers compensation insurance companies in Idaho. NCCI's filings are objectively prepared, utilizing widely accepted actuarial ratemaking methodologies.

In this year's filing, NCCI proposes the application of an additional digit to its published rating values to extend them from two to three decimal places. This change, known as "decimal extension," allows for more precise adjustments to rates, and Expected Loss Rates (ELRs). Decimal extension will be particularly beneficial for classification codes with lower rates because it will minimize rounding limitations that are currently more likely to impact these class codes. Currently, the smallest change in one of these values has to be at least 0.01, but after decimal extension, changes can be as small as 0.001. The methodology for determining the filed rates and ELRs is unchanged. The proposed decimal extension is premium-neutral on both a statewide and industry group basis.

## **Conclusion**

The workers compensation system remains healthy. For the last decade, the system has broadly benefited from a steady drop in claim frequency, rising wages, and moderate severity. The changing workforce and evolving economy also continue to impact workers compensation. Overall payroll growth persists, driven by an increase in employment and wage rates year over year. Preliminary data indicates a decrease in workers compensation net written premium in 2024, notwithstanding the growth in payroll. The combination of frequency declines and moderate benefit costs have contributed to reductions in overall workers compensation system costs.
