

Summary of the Proposed Oklahoma Workers Compensation Loss Cost and Assigned Risk Rate Filing Effective January 1, 2025

The National Council on Compensation Insurance (NCCI)¹ is pleased to provide this summary of the accompanying proposed workers compensation insurance loss cost² and assigned risk rate³ filing that was filed under separate cover on September 18, 2024, with the Oklahoma Insurance Department for its review and approval.

The filing recommends a –9.2% loss cost decrease in the voluntary market and a –9.2% rate decrease in the assigned risk market, effective January 1, 2025.

Oklahoma Overview

The current filing is based on premium and loss experience as of year-end 2023 from Policy Years 2021 and 2022 which shows improvement relative to the data underlying the June 1, 2024, filing. Oklahoma’s ratio of lost-time claims relative to premium has declined at a moderate rate since 2015, and the average indemnity and medical costs—after adjusting to a common wage level—also exhibit a decreasing pattern. Combining the projected improvement in loss experience with changes to Oklahoma’s medical fee schedule, effective July 1, 2024, and the proposed change to the Loss Adjustment Expense provision, results in a proposed change to the voluntary loss cost level of -9.2%.

With the adoption of the Oklahoma Residual Market, effective June 1, 2024, NCCI made its first assigned risk rate filing in the state in 2023. In this filing, NCCI proposes to maintain the currently approved assigned risk loss cost multiplier of 1.77, resulting in a proposed change of -9.2% for the assigned risk rate level.

Countrywide Overview

The workers compensation (WC) system remains healthy. The Calendar Year 2023 combined ratio for workers compensation was 86%, a sign of underwriting profitability, where the net written premium increased by 1%.

Frequency has continued its long-term decline and on a countrywide basis, while claim severity changes were considered moderate for 2023. The continued focus on worker safety and technological advancements are regarded as contributing to fewer workplace injuries over time. The latest medical severity change aligns with projected medical inflation, while indemnity severity tracked with changes in average weekly wages.

¹ NCCI is a licensed advisory organization authorized to make recommended loss cost and assigned risk rate filings on behalf of workers compensation insurance companies in Oklahoma. NCCI’s filings are objectively prepared, utilizing widely accepted actuarial ratemaking methodologies.

² “Loss cost” refers to the portion of workers compensation rates that are filed by the advisory organization and are allocated to pay losses but not carrier expenses. Some states include certain carrier expenses and assessments in the definition of “advisory loss costs.” Carriers can use the approved loss costs as the basis for their rates, typically adjusting them for expenses with a loss cost multiplier.

³ The assigned risk rate is filed for use on policies written through the Assigned Risk Plan, a program established by state insurance regulatory authorities that sets the rules and procedures for providing insurance coverage to parties that are unable to obtain coverage in the voluntary market. For the assigned risk market, NCCI files a full rate that includes the Servicing Carriers’ expenses.

Payroll increased by 6% between 2022 and 2023, driven by increases in both employment and wages. Conversely, WC system costs have increased at a slower pace than wages during the same period. The great reshuffle of jobs has also slowed significantly as employee turnover settles near pre-pandemic levels and we see signs of the labor market normalizing rather than deteriorating.

Economic inflation as measured with the Consumer Price Index has been elevated over the past few years. However, this economic inflation has not generally translated to higher WC medical and indemnity benefit costs:

- Medical inflation has been more stable in the aggregate with the WC Weighted Medical Price Index showing an average increase of 2.6% for the past 3 years. Medical fee schedules have helped moderate price increases in workers compensation in states that have adopted them.
- Indemnity severity has largely been tracking wage inflation in recent years—a pattern which is not unusual considering indemnity costs are essentially wage replacement benefits for injured workers.

Conclusion

The workers compensation system continues to be healthy. While consumer inflation has been elevated, the inflation for workers compensation medical costs remained stable. The increases observed in indemnity severity are largely driven by increased wages, which have risen significantly in recent years. Workers Compensation premiums are based on payroll, which is an inflation-sensitive exposure base. The combination of continued frequency declines and moderate benefit costs at or below the level of wage growth, have continued to put downward pressure on overall WC system costs relative to collected premiums.
